Why is a UHPC bridge cheaper than a normal bridge?

By considering the equivalent annual cost, the cost of the UHPC bridge can be smaller than that of the normal bridge, as the UHPC bridge can extend the structural service life. By considering the life-cycle cost and equivalent annual cost, different decisions associated with the UHPC and normal bridges can be made.

How to compare UhpC and normal concrete bridges?

By comparing the bridges with different service lives using UHPC and normal concrete, the equivalent annual cost is used. By considering the equivalent annual cost, the cost of the UHPC bridge can be smaller than that of the normal bridge, as the UHPC bridge can extend the structural service life.

Can UHPC bridges improve construction and repair efficiency?

As the use of UHPC can result in a reduction of construction time and number of workers, it has the significant potential to improve construction and repair efficiency. By considering this aspect, the life-cycle cost of the UHPC bridge has the potential to be less than that of the normal bridge.

What are the structural performance indicators for the normal bridge and UhpC bridge?

The structural performance indicators (e.g., environmental impacts, life-cycle cost) are assessed for the normal bridge and UHPC bridge. The computational flowchart of the performance indicators is shown in Fig. 8. In this section, the environmental impacts associated with these two bridges are investigated in a life cycle context.
