Why is thermal energy storage important?

Thermal energy storage can provide great flexibility, especially for low heating demand dwellings. Low investment cost thermal energy storage is one of the most important factors to improve its uptake. Heat pumps couple best with hot water tanks but have potential with low-cost latent heat storage that melts around 50°C.

Why is a high temperature a good choice for energy storage?

For DEH although the high temperature allows high energy storage densities, at the higher U values there are more losses and so there is little benefit until around 0.8 W/m<sup>2</sup> K, below this point the heat can better be retained to more efficiently use off-peak low emissions grid electricity.

Why is PCM used in thermal energy storage systems?

The PCM is added to enhance the thermal inertia and thereby smoothen the temperature fluctuation within the thermal comfort limits. Therefore, the main objective of adding passive technology is achieved with the minimal use of HVAC energy.

Is a storage-priority based control strategy better for HVAC systems?

Zhang et al. compared the performance of different storage capacity-based and priority-based control strategies for an HVAC system combined with a TES. They concluded that while the full storage control technique is superior for the summer, the storage-priority strategy is appropriate for winter.
