---

The most common CSP system in the United States is a linear concentrator that uses parabolic trough collectors. In such a system, the receiver tube is positioned along the focal line of each ...

The paper presents a systematic computer simulation work on a first-it-kind of solar light concentration and transmission system for applications in light-driven air dehumidification ...

The sun radiations are collected at solar collector and concentrated at the fiber optic cables placed at the focal point. The concentrated light is transmitted through the fiber optic cables in ...

OverviewCurrent technologyComparison between CSP and other electricity sourcesHistoryCSP with thermal energy storageDeployment around the worldCostEfficiencyCSP is used to produce electricity (sometimes called solar thermoelectricity, usually generated through steam). Concentrated solar technology systems use mirrors or lenses with tracking systems to focus a large area of sunlight onto a small area. The concentrated light is then used as heat or as a heat source for a conventional power plant (solar thermoelectricity). The solar concentrators use...

As part of NREL's Electricity, Resources, and Building Systems Integration Center, our R& D capabilities span the entire electricity system--from generation to transmission and distribution ...
