What are the main sources of electricity in Panama?

Thanks to its numerous rivers and water bodies, Panama capitalizes on renewable hydropower. Natural Gas: Contributing about 13.2%, natural gas is the second largest source of electricity generation. Solar Power: With increasing investments in renewable energy, solar power now constitutes approximately 4.8% of the total electricity mix.

What is Panama's power system like in 2017?

In 2017, Panama's power system had very large installed hydropower capacity (54% of total capacity) and substantial VRE capacity (45.3%). The generation breakdown was 64% renewable energy (36% run-of-river hydro, 18% reservoir hydro, 8% wind, 2% solar photovoltaics (PV)) and 36% thermal generation (29% oil and 7% coal).

Who manages electricity in Panama?

In Panama, this critical stage is managed by the Electric Transmission Company, S.A. (ETESA), which is wholly state-owned. ETESA ensures the reliable and efficient flow of electricity across the country's grid, addressing the demands of both urban and rural areas. The distribution of electricity to end users is handled by three main companies:

Does Panama need a cross-border electricity market?

In the absence of a cross-border electricity market, this interconnection was modelled assuming that Panama imports energy from Colombia at the high price of USD 200 per megawatt-hour (MWh). Because imports are likely the most expensive source of electricity, they will be required only if Panama's internal generation mix is unable to meet demand.

Let's face it - most people don't wake up thinking about distributed control energy storage power stations. But guess what? That latte you're sipping right now probably relies on similar ...
